

In the Abstract

Please replace the Abstract with the following amended Abstract:

—A device that delivers a powdery medicine for a nasal cavity includes positioning guides that cause a capsule to slide as far as a predetermined position and are provided on the side of cutters to make holes on both ends of the capsule provided between the connection port on the side of a nozzle that sprays the powdery medicine into the nasal cavity. The device further includes a connection port on the side of a pump that supplies spray air to the nozzle in order to make the size of the holes made on both ends of the capsule constant, wherein a distance between the connection ports is made shorter than a distance between blade tips of the cutters (length of the capsule after cutting off the both ends by the cutters), to prevent scattering of the powdery medicine in the capsule from both ends of the capsule provided between the connection ports, so that both ends of the capsule loaded between the connection ports are pressed by peripheral edges of the connection ports.—
